

## Robotics Foundation Web App User Evaluation

### Han Meng Loo

The aim of this experiment is to investigate the potential of this web app being an alternative platform for the robotics foundation students to work on their weekly lab exercises. We cannot tell how good the web app is unless we ask participants for their feedback. I will give you some time to browse the pages to familiarise yourselves before performing a series of tasks. For each completed task, I will ask you some questions relating to it. I will be observing you while you perform the tasks. Please ask questions if you need to.

I will ask you some questions at the end of the experiment. The data collected from this experiment would be your answer. Please remember that it is the web app, not you, that is being evaluated. You are welcome to withdraw from the experiment at any time. Do you agree to taking part in this evaluation? Do you have any questions before we start?

Possible questions:

- Will the user answer in pen and paper OR verbal and i write their answers down
- Ask questions after each task, how easy to create account, navigate, code OR ask all questions after they have completed all tasks
- General aim, either as an alternative (thus needing to use both web apps) OR evaluating suitability/ease of use/overall satisfaction of THIS web app only
- Track user time completing tasks ?
